

## SECTION 3 OVERVIEW

This section contains information about the entire MC68336/376 modular microcontroller. It lists the features of each module, shows device functional divisions and pin assignments, summarizes signal and pin functions, discusses the intermodule bus, and provides system memory maps. Timing and electrical specifications for the entire microcontroller and for individual modules are provided in **APPENDIX A ELECTRICAL CHARACTERISTICS**. Comprehensive module register descriptions and memory maps are provided in **APPENDIX D REGISTER SUMMARY**.

### 3.1 MCU Features

The following paragraphs highlight capabilities of each of the microcontroller modules. Each module is discussed separately in a subsequent section of this user's manual.

#### 3.1.1 Central Processing Unit (CPU32)

- 32-bit architecture
- Virtual memory implementation
- Table look-up and interpolate instruction
- Improved exception handling for controller applications
- High level language support
- Background debug mode
- Fully static operation

#### 3.1.2 System Integration Module (SIM)

- External bus support
- Programmable chip select outputs
- System protection logic
- Watchdog timer, clock monitor and bus monitor
- Two 8-bit dual function input/output ports
- One 7-bit dual function output port
- Phase-locked loop (PLL) clock system

#### 3.1.3 Standby RAM Module (SRAM)

- 4-Kbytes of static RAM
- No standby supply

#### 3.1.4 Masked ROM Module (MRM)

- 8-Kbyte array, accessible as bytes or words
- User selectable default base address
- User selectable bootstrap ROM function
- User selectable ROM verification code

### 3.1.5 10-Bit Queued Analog-to-Digital Converter (QADC)

- 16 channels internally; up to 44 directly accessible channels with external multiplexing
- Six automatic channel selection and conversion modes
- Two channel scan queues of variable length, each with a variable number of sub-queues
- 40 result registers and three result alignment formats
- Programmable input sample time
- Direct control of external multiplexers

### 3.1.6 Queued Serial Module (QSM)

- Enhanced serial communications interface (SCI)
- Modulus baud rate generator
- Parity detection
- Queued serial peripheral interface (QSPI)
- 80-byte static RAM to perform queued operations
- Up to 16 automatic transfers
- Continuous cycling, 8 to 16 bits per transfer, LSB or MSB first
- Dual function I/O pins

### 3.1.7 Configurable Timer Module Version 4 (CTM4)

- Two 16-bit modulus counter submodules (MCSMs)
- 16-bit free-running counter submodule (FCSM)
- Four double-action submodules (DASMs)
- Four pulse-width submodules (PWMSMs)

### 3.1.8 Time Processor Unit (TPU)

- Dedicated micro-engine operating independently of the CPU32
- 16 independent programmable channels and pins
- Each channel has an event register consisting of a 16-bit capture register, a 16-bit compare register and a 16-bit comparator
- Any channel can perform any time function
- Each channel has six or eight 16-bit parameter registers
- Each timer function may be assigned to more than one channel
- Two timer counter registers with programmable prescalers
- Each channel can be synchronized to one or both counters
- Selectable channel priority levels

### 3.1.9 Static RAM Module with TPU Emulation Capability (TPURAM)

- 3.5 Kbytes of static RAM
- External VSTBY pin for separate standby supply
- May be used as normal RAM or TPU microcode emulation RAM

### 3.1.10 CAN 2.0B Controller Module (TouCAN)

- Full implementation of CAN protocol specification, version 2.0 A and B
- 16 receive/transmit message buffers of 0 to 8 bytes data length
- Global mask register for message buffers 0 to 13
- Independent mask registers for message buffers 14 and 15
- Programmable transmit-first scheme: lowest ID or lowest buffer number
- 16-bit free-running timer for message time-stamping
- Low power sleep mode with programmable wake-up on bus activity

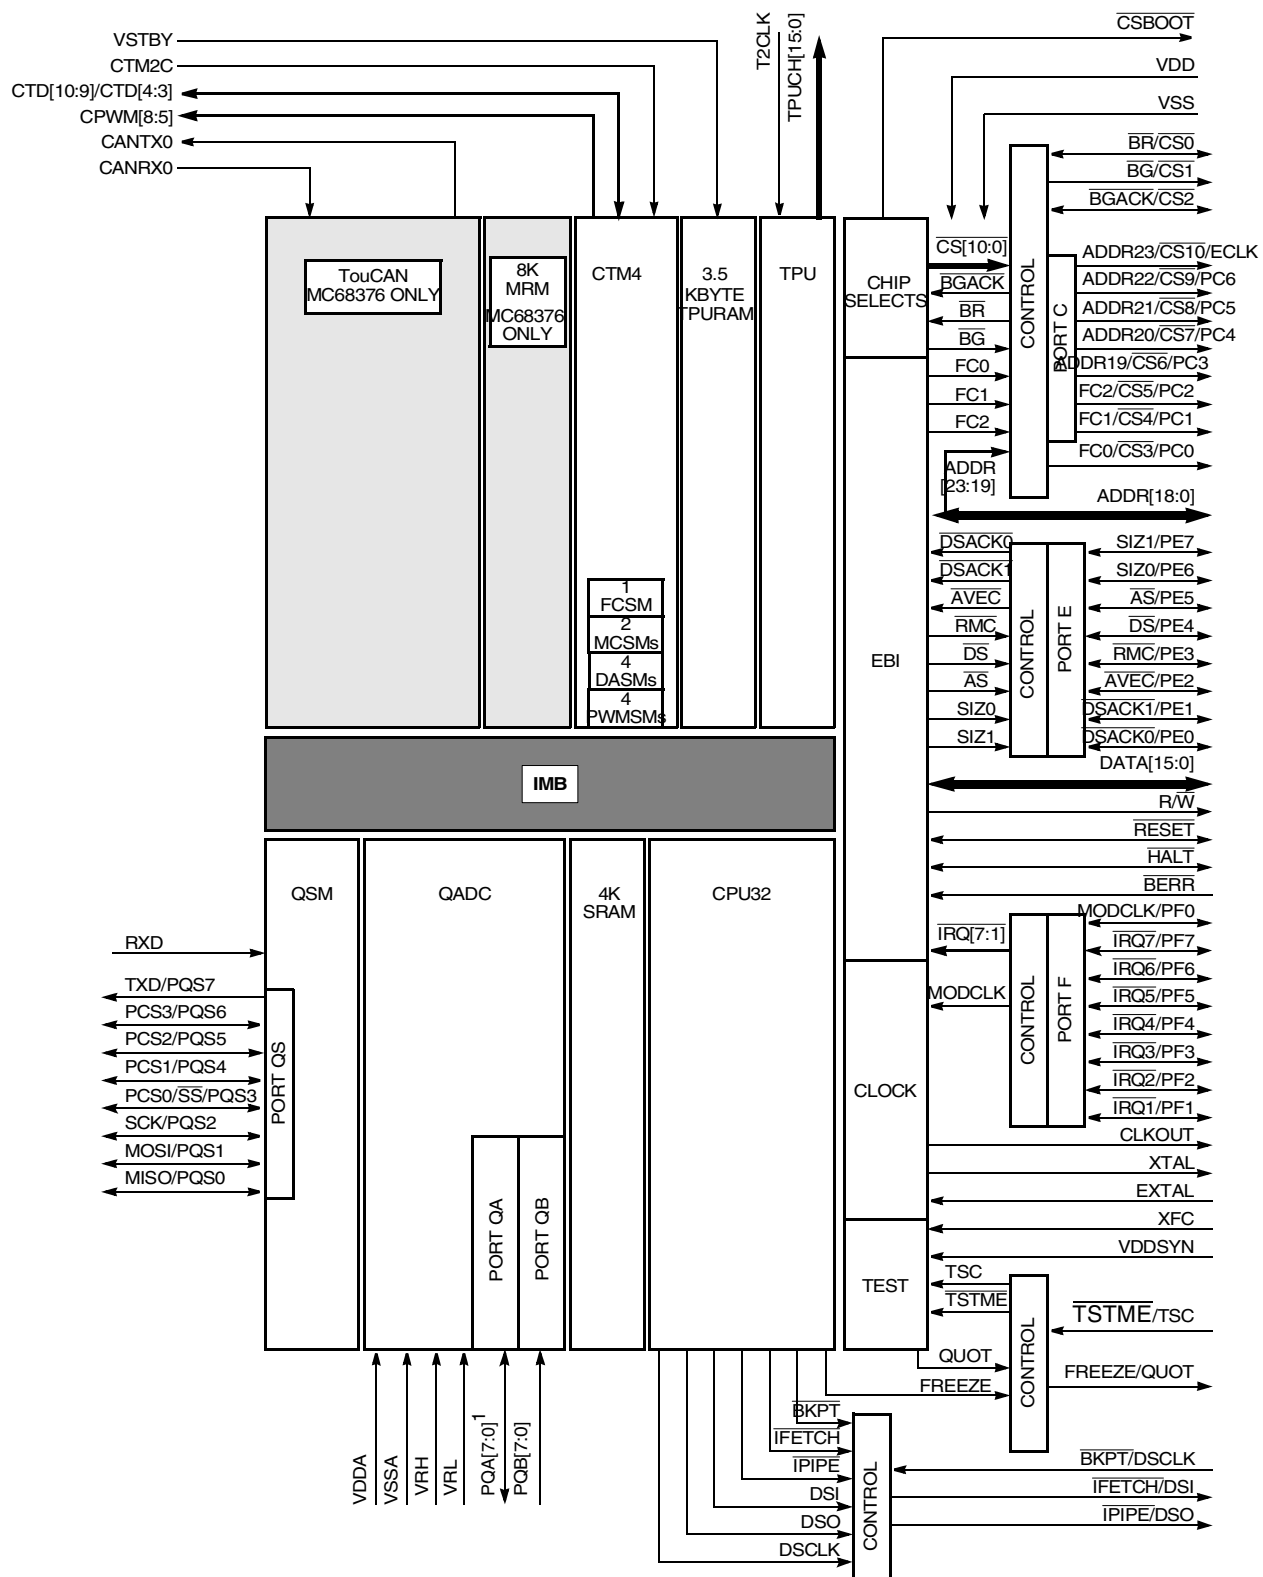

### 3.2 Intermodule Bus

The intermodule bus (IMB) is a standardized bus developed to facilitate both design and operation of modular microcontrollers. It contains circuitry to support exception processing, address space partitioning, multiple interrupt levels, and vectored interrupts. The standardized modules in the MCU communicate with one another through the IMB. The IMB in the MCU uses 24 address and 16 data lines.

### 3.3 System Block Diagram and Pin Assignment Diagrams

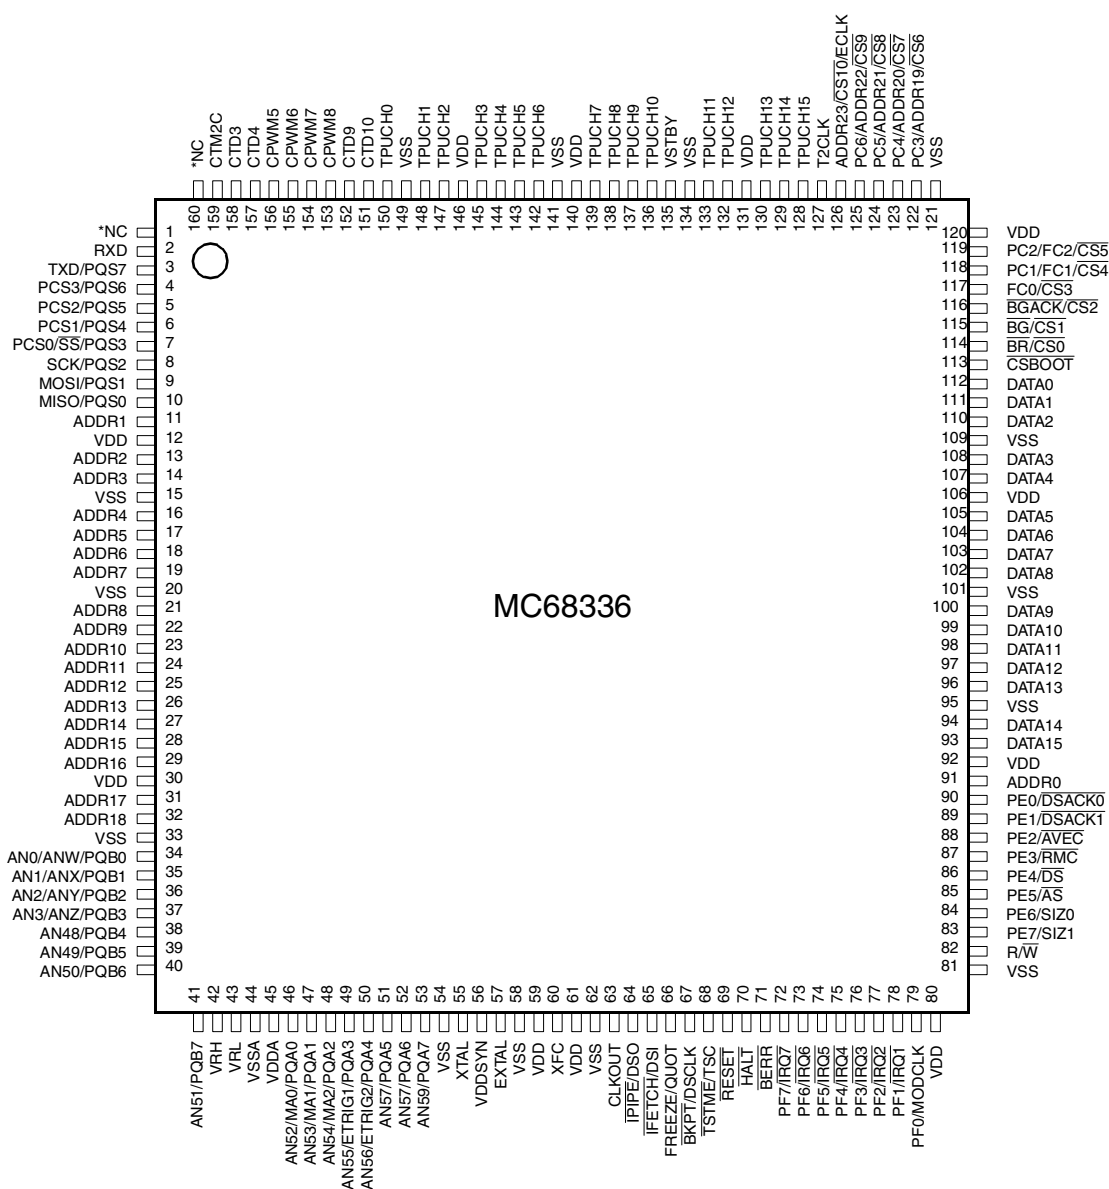

**Figure 3-1** is a functional diagram of the MCU. There is not a one-to-one correspondence between location and size of blocks in the diagram and location and size of integrated-circuit modules. **Figure 3-2** shows the MC68336 pin assignment package; **Figure 3-3** shows the MC68376 pin assignment package. Note that the MC68376 is a pin-compatible upgrade for the MC68336 that provides a CAN protocol controller and an 8-Kbyte masked ROM module. Both devices use a 160-pin plastic surface-mount package. Refer to **B.1 Obtaining Updated MC68336/376 Mechanical Information** for package dimensions. Refer to subsequent paragraphs in this section for pin and signal descriptions.

1. PORT A PINS INCORPORATE OPEN DRAIN PULL DOWN DRIVERS

336/376 BLOCK

**Figure 3-1 MC68336/376 Block Diagram**

\*NOTE: MC68336 REVISION D AND LATER (F60K AND LATER MASK SETS) HAVE ASSIGNED PINS 1 AND 160 AS "NO CONNECT", TO ALLOW PIN COMPATIBILITY WITH THE MC68376. FOR REVISION C (D65J MASK SET) DEVICES, PIN 1 IS V<sub>SS</sub> AND PIN 160 IS V<sub>DD</sub>.

**Figure 3-2 MC68336 Pin Assignments for 160-Pin Package**

Figure 3-3 MC68376 Pin Assignments for 160-Pin Package

### 3.4 Pin Descriptions

The following tables summarize the functional characteristics of MC68336/376 pins. **Table 3-1** shows all inputs and outputs. Digital inputs and outputs use CMOS logic levels. An entry in the “Discrete I/O” column indicates that a pin can also be used for general-purpose input, output, or both. The I/O port designation is given when it applies. Refer to **Figure 3-1** for port organization. **Table 3-2** shows types of output drivers. **Table 3-3** shows the characteristics of power pins.

**Table 3-1 MC68336/376 Pin Characteristics**

Pin Mnemonic	Output Driver	Input Synchronized	Input Hysteresis	Discrete I/O	Port Designation

XFC <sup>2</sup>	—	—	—	Special	—
XTAL <sup>2</sup>	—	—	—	Special	—

**NOTES:**

1. DATA[15:0] are synchronized during reset only. MODCLK, and the QSM and QADC pins are synchronized only when used as input port pins.
2. EXTAL, XFC and XTAL are clock reference connections.

**Table 3-2 MC68336/376 Output Driver Types**

Type	Description
A	Output only signals that are always driven. No external pull-up required.
Ao	Type A output that can be operated in an open-drain mode.
Aw	Type A output with p-channel precharge when reset.
B	Three-state output that includes circuitry to assert output before high impedance is established, to ensure rapid rise time. An external holding resistor is required to maintain logic level while in the high-impedance state.
Bo	Type B output that can be operated in an open-drain mode.
Ba	Three-state output that can be operated in open-drain mode only.

**Table 3-3 MC68336/376 Power Connections**

Pin	Description
V <sub>STBY</sub>	Standby RAM power
V <sub>DDSYN</sub>	Clock synthesizer power
V <sub>DDA</sub> , V <sub>SSA</sub>	QADC converter power
V <sub>RH</sub> , V <sub>RL</sub>	QADC reference voltage
V <sub>SS</sub> , V <sub>DD</sub>	Microcontroller power

**3.5 Signal Descriptions**

The following tables define the MC68336/376 signals. [Table 3-4](#) shows signal origin, type, and active state. [Table 3-5](#) describes signal functions. Both tables are sorted alphabetically by mnemonic. MCU pins often have multiple functions. More than one description can apply to a pin.

**Table 3-4 MC68336/376 Signal Characteristics**

Signal Name	MCU Module	Signal Type	Active State
ADDR[23:0]	SIM	Bus	—
AN[59:48]/[3:0]	QADC	Input	—
AN[w, x, y, z]	QADC	Input	—
$\overline{AS}$	SIM	Output	0
$\overline{AVEC}$	SIM	Input	0
$\overline{BERR}$	SIM	Input	0

XTAL	SIM	Output	—

**Table 3-5 MC68336/376 Signal Functions**

Mnemonic	Signal Name	Function
ADDR[23:0]	Address Bus	24-bit address bus used by the CPU32
AN[59:48]/[3:0]	QADC Analog Input	16 channel A/D converter analog input pins
AN[w, x, y, z]	QADC Analog Input	Four input channels utilized when operating in multiplexed mode
$\overline{AS}$	Address Strobe	Indicates that a valid address is on the address bus
$\overline{AVEC}$	Autovector	Requests an automatic vector during interrupt acknowledge
$\overline{BERR}$	Bus Error	Indicates that a bus error has occurred
$\overline{BG}$	Bus Grant	Indicates that the MCU has relinquished the bus
$\overline{BGACK}$	Bus Grant Acknowledge	Indicates that an external device has assumed bus mastership
$\overline{BKPT}$	Breakpoint	Signals a hardware breakpoint to the CPU
$\overline{BR}$	Bus Request	Indicates that an external device requires bus mastership
CLKOUT	System Clock Out	System clock output
CANRX0	TouCAN Receive Data	CAN serial data input
CANTX0	TouCAN Transmit Data	CAN serial data output
$\overline{CS}[10:0]$	Chip-Selects	Select external devices at programmed addresses
$\overline{CSBOOT}$	Boot Chip-Select	Chip-select for external bootstrap memory
CPWM[8:5]	CTM4 PWMs	Four pulse-width modulation channels
CTD[10:9]/[4:3]	CTM4 Double Action Channels	Bidirectional double action timer channels
CTM2C	CTM4 Modulus Clock	Modulus counter clock input
DATA[15:0]	Data Bus	16-bit data bus used by the CPU32
$\overline{DS}$	Data Strobe	Indicates that an external device should place valid data on the data bus during a read cycle and that valid data has been placed on the data bus by the CPU during a write cycle.
$\overline{DSACK}[1:0]$	Data and Size Acknowledge	Provides asynchronous data transfers and dynamic bus sizing
DSI, DSO, DSCLK	Developmental Serial In, Out, Clock	Serial I/O and clock for background debug mode
ECLK	E-Clock	M6800 bus clock output
ETRIG[2:1]	QADC External Trigger	External trigger pins used when a QADC scan queue is in external trigger mode
EXTAL, XTAL	Crystal Oscillator	Connections for clock synthesizer circuit reference; a crystal or an external oscillator can be used
FC[2:0]	Function Codes	Identify processor state and current address space
FREEZE	Freeze	Indicates that the CPU has acknowledged a breakpoint
$\overline{HALT}$	Halt	Suspend external bus activity
$\overline{IFETCH}$	Instruction Pipeline	Indicates instruction pipeline activity
$\overline{IPIPE}$	Instruction Pipeline	Indicates instruction pipeline activity
$\overline{IRQ}[7:1]$	Interrupt Request	Requests an interrupt of specified priority level from the CPU
MA[2:0]	QADC Multiplexed Address	When external multiplexing is used, these pins provide addresses to the external multiplexer
MISO	Master In, Slave Out	Serial input to QSPI in the master mode; serial output from QSPI in the slave mode
MODCLK	Clock Mode Select	Selects the source of the system clock

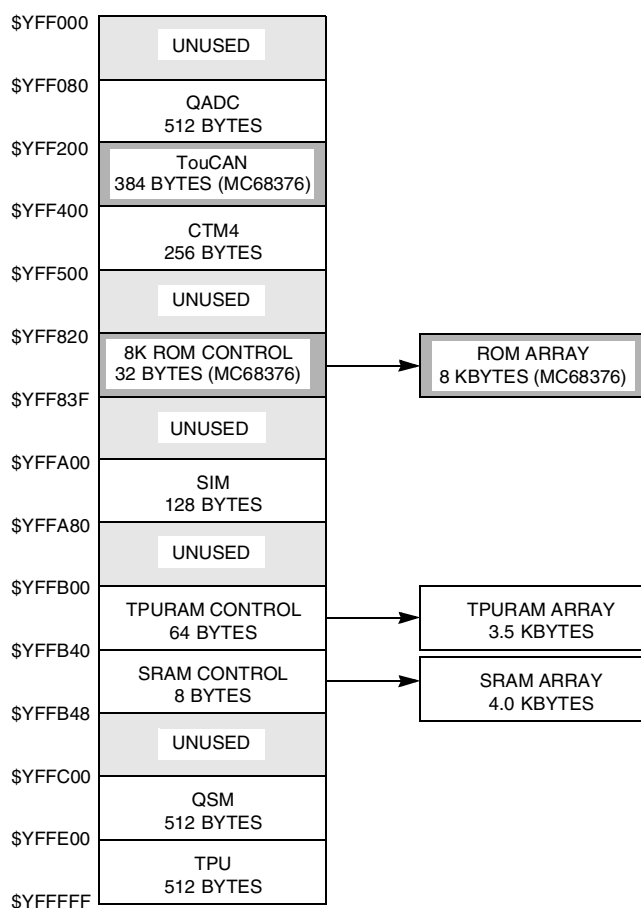

**Table 3-5 MC68336/376 Signal Functions (Continued)**

Mnemonic	Signal Name	Function
MOSI	Master Out, Slave In	Serial output from the QSPI in master mode; serial input to the QSPI in slave mode
PC[6:0]	Port C	SIM digital output port signals
PCS[3:0]	Peripheral Chip-Selects	QSPI peripheral chip-select
PE[7:0]	Port E	SIM digital input/output port signals
PF[7:0]	Port F	SIM digital input/output port signals
PQA[7:0]	QADC Port A	QADC port A digital input/output port signals
PQB[7:0]	QADC Port B	QADC port B digital input port signals
PQS[7:0]	Port QS	QSM digital input/output port signals
QUOT	Quotient Out	Provides the quotient bit of the polynomial divider (test mode only)
R/W	Read/Write	Indicates the direction of data transfer on the bus
RESET	Reset	System reset
RMC	Read-Modify-Write Cycle	Indicates an indivisible read-modify-write instruction
RXD	SCI Receive Data	Serial input to the SCI
SCK	QSPI Serial Clock	Clock output from QSPI in master mode; clock input to QSPI in slave mode
SIZ[1:0]	Size	Indicates the number of bytes remaining to be transferred during a bus cycle
SS	Slave Select	Starts serial transmission when QSPI is in slave mode; chip-select in master mode
T2CLK	TPU Clock	TPU clock input
TPUCH[15:0]	TPU I/O Channels	Bidirectional TPU channels
TSC	Three-State Control	Places all output drivers in a high impedance state
TSTME	Test Mode Enable	Hardware enable for SIM test mode
TXD	SCI Transmit Data	Serial output from the SCI
XFC	External Filter Capacitor	Connection for external phase-locked loop filter capacitor

### 3.6 Internal Register Map

In [Figure 3-4](#), IMB ADDR[23:20] are represented by the letter Y. The value represented by Y determines the base address of MCU module control registers. In the MC68336/376, Y is equal to M111, where M is the logic state of the module mapping (MM) bit in the system integration module configuration register (SIMCR).

- NOTES: 1. Y=M111, WHERE M IS THE MODMAP SIGNAL STATE ON THE IMB, WHICH REFLECTS THE STATE OF THE MODMAP IN THE MODULE CONFIGURATION REGISTER OF THE SYSTEM INTEGRATION MODULE. (Y=\$7 OR \$F)
2. ATTEMPTED ACCESSES TO UNUSED LOCATIONS OR UNUSED BITS WITHIN VALID LOCATIONS RETURN ALL ZEROS.

336/376 ADDRESS MAP

**Figure 3-4 MC68336/376 Address Map**

### 3.7 Address Space Maps

**Figure 3-5** shows a single memory space. Function codes FC[2:0] are not decoded externally so that separate user/supervisor or program/data spaces are not provided. In **Figure 3-6**, FC2 is decoded, resulting in separate supervisor and user spaces. FC[1:0] are not decoded, so that separate program and data spaces are not provided. In **Figures 3-7** and **3-8**, FC[2:0] are decoded, resulting in four separate memory spaces: supervisor/program, supervisor/data, user/program and user/data.

All exception vectors are located in supervisor data space, except the reset vector, which is located in supervisor program space. Only the initial reset vector is fixed in the processor's memory map. Once initialization is complete, there are no fixed assignments. Since the vector base register (VBR) provides the base address of the

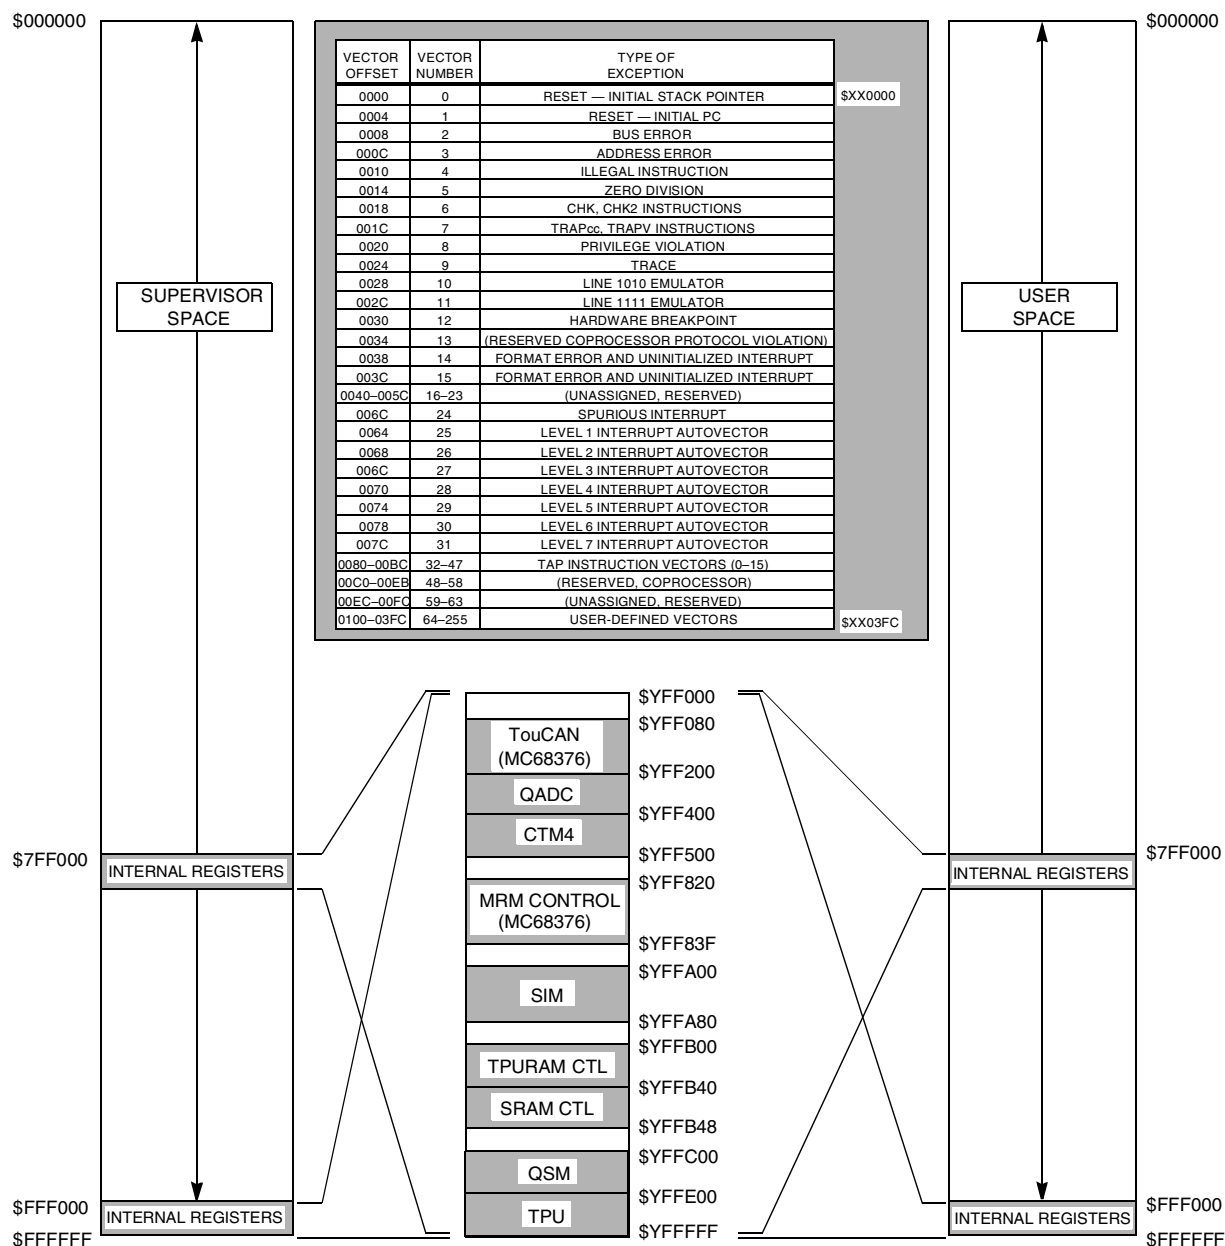

vector table, the vector table can be located anywhere in memory. Refer to **SECTION 4 CENTRAL PROCESSOR UNIT** for more information concerning memory management, extended addressing, and exception processing. Refer to **5.5.1.7 Function Codes** for more information concerning function codes and address space types.

- NOTES:
1. LOCATION OF THE EXCEPTION VECTOR TABLE IS DETERMINED BY THE VECTOR BASE REGISTER. THE VECTOR ADDRESS IS THE CONCATENATION OF THE UPPER 22 BITS OF THE VBR WITH THE 8-BIT VECTOR NUMBER OF THE INTERRUPTING MODULE. THE RESULT IS LEFT JUSTIFIED TO FORCE LONG WORD ALIGNMENT.
  2. LOCATION OF THE MODULE CONTROL REGISTERS IS DETERMINED BY THE STATE OF THE MODULE MAPPING (MM) BIT IN THE SIM CONFIGURATION REGISTER. Y = M111 WHERE M IS THE STATE OF THE MM BIT.
  3. SOME UNUSED ADDRESSES WITHIN THE INTERNAL REGISTER BLOCK ARE MAPPED EXTERNALLY. REFER TO THE APPROPRIATE MODULE REFERENCE MANUAL FOR INFORMATION ON MAPPING OF UNUSED ADDRESSES WITHIN INTERNAL REGISTER BLOCKS.
